Brauer Wheels and Castors was established in 1926 and for over 85 years has been designing and manufacturing the very best in quality wheels and castors in materials from nylon through to stainless steel. Today Brauer Wheels and Castors are found throughout the world in applications as industrially diverse as the nuclear industry to agricultural machinery.

Over the years we have developed the knowledge and expertise to help solve any wheel or castor related enquiries. Our design team is second to none in the design of wheels and castors to meet any requirement the customer may have. The skills inherent in our design engineering team are supported by the latest computer aided design facilities including 3 dimensional feature based parametric solid modelling and finite element analysis. These features ensure we maintain our pre-eminent position as the No 1 designer and manufacturer of industrial wheels and castors.

Durable by Design comes from the experience and support of our partners worldwide and internal and external engineers, you will see that when it comes to industrial wheels and castors there is only one company to be with.

Whether you require a standard catalogue item from stock, a simple non-standard version of a standard wheel/castor or a complete wheel and axle/castor assembly specially designed for your specific requirement, you can be sure that Brauer Wheels and Castors will meet your needs.

Heavithane is a registered trade mark of Brauer Ltd.

Brauer Ltd reserves the right to change the design or specification of the products shown in this catalogue without prior notification.

DESIGN SERVICE OUTLINE AND DATA

18 - 31

WHEELS & AXLE ASSEMBLIES

32 - 89

Steel Single Flanged Rail Wheels Page 33 - 35

Series 'SSF'
 Wheel Dia Ø75-600
 Load Range 975-30900Kg

Cast Iron Single Flanged Rail Wheels Page 36 - 38

Series 'CSF'
 Wheel Dia Ø63-300
 Load Range 200-2300Kg

Steel Double Flanged Rail Wheels Page 39 - 42

Series 'SDF'
 Wheel Dia Ø75-600
 Load Range 1350-30900Kg

Cast Iron Double Flanged Rail Wheels Page 43 - 44

Series 'CDF'
 Wheel Dia Ø130-300
 Load Range 650-2300Kg

Steel Flat Tread Rail Wheels Page 45 - 47

Series 'SFT'
 Wheel Dia Ø75-600
 Load Range 2300-46300Kg

Cast Iron Flat Tread Rail Wheels Page 48 - 49

Series 'CFT'
 Wheel Dia Ø130-300
 Load Range 1200-4000Kg

Cast Nylon Flat Tread Rail Wheels Page 50 - 51

Series 'NFT'
 Wheel Dia Ø200-400
 Load Range 2350-7850Kg

Cast Nylon Double Flanged Rail Wheels Page 52 - 53

Series 'NDF'
 Wheel Dia Ø200-400
 Load Range 1960-4770Kg

Steel 'V' Grooved Wheels Page 54 - 55

Series 'SVT'
 Wheel Dia Ø75-300
 Load Range 800-7100Kg

Polyurethane Tyred Single-flanged Rail Wheels Page 56 - 57

Series 'SFH'
 Wheel Dia Ø100-200
 Load Range 450-1400Kg

WHEELS & AXLE ASSEMBLIES (continued)

32 - 89

Single Flanged 'I' Beam & Channel Wheels - Flat Tread Page 58

Series 'SSFF'
 Wheel Dia Ø55-200
 Load Range 370-2000Kg

Single Flanged 'I' Beam & Channel Wheels - Radius Tread Page 59

Series 'SFR & SSFR'
 Wheel Dia Ø55-175
 Load Range 160-1500Kg

Rail Page 60 - 63

Cast Iron Untyred Wheels Page 64 - 67

Series 'C'
 Wheel Dia Ø75-350
 Load Range 400-5700Kg

Polyurethane Tyred Wheels Page 68 - 73

Series 'H'
 Wheel Dia Ø75-460
 Load Range 300-5200Kg

Guide Rollers Page 74 - 77

Series Vulkollan 90 & Vulkopan 59
 Wheel Dia Ø18-125
 Load Range 10-260Kg

Polyurethane 'Press-On-Band' Tyred Wheels Page 78 - 81

Series 'PH'
 Wheel Dia Ø250-500
 Load Range 2000-4800Kg

Rubber Tyred Wheels Page 82 - 83

Series 'R'
 Wheel Dia Ø100-200
 Load Range 120-400Kg

WHEELS & AXLE ASSEMBLIES (continued)

32 - 89

Rubber Tyred 'Press-on Band' Page 84

Series 'PR'
Band Dia Range Ø380-460
Load Range 1240-1470Kg

Axle Brackets Page 86

Series 'B'
Load Range Up To 20000Kg

Twin Wheel Axle Assemblies Page 87

Series 'A'
Load Range Up To 12000Kg

Single Wheel Axle Assemblies Page 88

Series 'BA'
Load Range Up To 40000Kg

Untyred Nylon Wheels Page 85

Series 'N'
Wheel Dia Ø50-250
Load Range 80-2000Kg

Cantilevered Stub Axle Assemblies Page 89

Series 'CA'
Wheel Dia Up To 1100Kg

AVAILABLE ADDITIONS TO STANDARD SPECIFICATIONS

H7 TOLERANCE

GRUB SCREWS

ANTI-HYDROLYSIS TO POLYURETHANE

FLAT TREAD OPTIONS

THROUGH AXLE GREASE (TAG)

CROWN TREAD ON POLY WHEELS

FLAME HARDENING

INDUSTRIAL CASTORS

90 - 112

Pivoting Castors Page 91

Designed to Order
Load Range Up to and exceeding 200 Tonne

Pneumatic Tyred Castor Single Wheel Page 92

Series 'WG'
Wheel Dia Ø535
Load Range Up to 2100Kg

Pneumatic Tyred Castor Twin Wheel Page 93

Series 'TQZ'
Wheel Dia Ø535
Load Range Up to 4200Kg

UHQZ Series with Various Wheels Swivel load Rating 12000Kg Page 95

Series 'UHQZ'
Wheel Dia Ø350-500
Load Range 6400-12000Kg

HQZ Series with Various Wheels Swivel load Rating 7300Kg Page 96

Series 'HQZ'
Wheel Dia Ø200-380
Load Range 6200-7300Kg

TQZ Series with Various Wheels Swivel load Rating 5100Kg Page 97

Series 'TQZ'
Wheel Dia Ø200-300
Load Range 4000-5100Kg

QZ Series with Various Wheels Swivel load Rating 4200Kg Page 98

Series 'QZ'
Wheel Dia Ø200-380
Load Range 3100-4200Kg

TWG Series with Various Wheels Swivel load Rating 3000Kg Page 99

Series 'TWG'
Wheel Dia Ø150
Load Range 1200 -3000Kg

WG Series with Various Wheels Swivel load Rating 3000Kg Page 100

Series 'WG'
Wheel Dia Ø150-300
Load Range 900-3000Kg

GG Series with Various Wheels Swivel load Rating 1500Kg Page 101

Series 'GG'
Wheel Dia Ø100-250
Load Range 450-1500Kg

INDUSTRIAL CASTORS (continued)

90 - 112

LG Series with Polyurethane Tyred Wheel
Swivel load Rating 1000Kg Page 102
 Series 'LG'
 Wheel Dia Ø125-150
 Load Range 400-600Kg

H Series with Polyurethane Tyred Wheel
Swivel load Rating 1500Kg Page 103
 Series 'HS & HF'
 Wheel Dia Ø100-300
 Load Range 500-1500Kg

F Series with Polyurethane Tyred Wheel
Swivel load Rating 380Kg Page 104
 Series' 'FS' & 'FF'
 Wheel Dia Ø75-150
 Load Range 300-380Kg

E Series with Polyurethane Tyred Wheel
Swivel load Rating 380Kg Page 105 - 106
 Series' 'ES' & 'EF'
 Wheel Dia Ø76-200
 Load Range 100-380Kg

E Series with High Temperature Phenolic Wheel
Swivel load Rating 250Kg Page 107
 Series' 'ES' & 'EF'
 Wheel Dia Ø76-150
 Load Range 100-250Kg

600Kg Jacking Unit Page 108
 Series 'JBG'
 Wheel Dia Ø125-200
 Load Range Up to 600Kg

1000Kg Jacking Unit Page 109
 Series 'JGG'
 Wheel Dia Ø100-250
 Load Range Up to 1000Kg

1600Kg Jacking Unit Page 110
 Series 'JMG'
 Wheel Dia Ø150-300
 Load Range Up to 1600Kg

2500Kg Jacking Unit Page 111
 Series 'JWG'
 Wheel Dia Ø150-300
 Load Range Up to 2500Kg

Floor Locks Page 112
 Series 'FL'
 Wheel Dia Ø100-150

Applications and Examples

Brauer Ltd manufactured according to the design specification of J Murphy and Sons Limited, Gas pipe tunnel trollies for the gas ring main improvement to the west of London from Harefield to Southall for the National Grid.

The gas pipe is required to be push/pulled into position and statically supported whilst empty (565kg/m), until the tunnel annulus is filled, the trollies must also support the pipe when filled with water to support hydro testing (1735kg/m)

The 4 sections of the tunnel have lengths of 974m, 756m, 505m and 207m respectively and the total improvement section is 27 kilometres

The bored tunnel of concrete section was 2.2m diameter and the gas pipe within this tunnel was 1.2m diameter leaving very limited space between the two, so the gas pipe supporting trollies had to be small enough to enter this gap between the pipe and the tunnels walls but have very high loading capacity to take the gas pipe as it was pulled/pushed into the outer tunnel. The rail system for the trollies was laid on a bed of silicon sand.

Brauer Ltd provided a total solution of 88 low height / high load capacity trollies which ranged from 10,000Kg each to 22,000Kg each.

7600 tonne, 32 meter diameter, pipe laying turntable running on 330 steel double flange rail wheels fitted with self-lubricating bushes and stainless steel shafts.
Tread diameter 450mm.
Tread width 112mm wide with crown profile to assist tracking.
Tread and inner flange flame hardened to ensure a service wear life in excess of seven years.

Applications and Examples

BRAUER[®]

Ship mounted cable and pipe carousels used in the offshore wind farm, renewable energy and energy supply industries loaded capacities between 2,500 tonnes to 15,000 tonnes

This ship mounted pipe laying turntable which is running on three rings of tapered tread steel wheels mounted in a fixed frame. The wheels and frame are finished in marine specification paint. Total weight when loaded is 600 tonnes with each wheel and bracket capable of carrying 50 tonnes.

APPLICATIONS AND EXAMPLES

A ship lift and transfer dock system for removing ships from the sea and then transferring ships around the dock for repair and maintenance to take place. Three sizes of wheels are used throughout the dock.

Rated Load

SDF 450/95/TBM75FH + AXLE	25500 Kg
SDF 350/85/TBM75FH + AXLE	19500 Kg
SDF 250/80/TBM50FH + AXLE	13000 Kg

FH = Flame Hardened

The SDF 250 and 350 being primarily used on the ship lift trolley with the SDF 450 mainly on the transfer system. The wheels have been simplified and redesigned to ensure longer life, easier installation and lower maintenance.

Applications and Examples

Multi-pivoting, dual purpose castor with directional swivel top plate. Fitted with 4 steel double flange rail wheels, 450mm tread diameter and 90mm tread width and 8 anti-hydrolysis polyurethane tyred wheels, 505mm tread diameter and 150mm tread width. All axles are ground stainless steel running in self lubricating nylon bushes.

Load Rating

- a) When mounted on rail and running on the double flange wheels – 160 tonne per castor assembly.
- b) When running on polyurethane tyred wheels – 76.8 tonne per castor assembly.

Wheel and axle assemblies used in a rotating drum application. Given the extreme conditions and high loadings involved the wheels and axles have been specifically designed to the customers requirements that demand flat tread wheels with axles that are capable of taking a load in excess of 75 tonnes.

The wheels shown are SFT600/250/KM150 with an axle Ø150mm reducing to 100mm for the bearing housing.

APPLICATIONS AND EXAMPLES

These special 28 tonne and 42 tonne pivot castors were designed to be used on 115 tonne capacity electro-mechanically controlled Portal Stands

The portal stands are used in the support of the wire tension cable as part of a steel rope manufacturing process.

The machines to carry out this process were manufactured in England and then exported to the Steel Wire Rope and Tension Cable Manufacturing company in Scandinavia.

Applications and Examples

Access Gantry on Severn Bridge

Polyurethane tyred drive wheel. Tread diameter 500mm. Tread width 100mm.

Maximum radial load capacity 50KN. Tyre 95-98 Shore 'A' hardness directly bonded to aluminium grade BS1471-6082 - T6 centre to significantly reduce the weight for ease of handling. Aluminium anodised to prevent corrosion. Stainless steel hub bored and keywayed with interface between stainless steel hub and aluminium centre coated to prevent electrolytic action.

Access Gantry on Second Severn Bridge

Polyurethane tyred wheel fitted with spherical roller bearings. Tread diameter 500mm. Tread width 100mm. Maximum radial load capacity 50KN. Tyre 95-98 Shore 'A' hardness directly bonded to aluminium grade BS1471-6082-T6 centre to significantly reduce the weight for ease of handling. Aluminium anodised to prevent corrosion.

APPLICATIONS AND EXAMPLES

Swing bridge on Caledonian Canal at Fort Augustus

Fixed castor fitted with 686mm diameter EN24T steel wheel with composite PTFE bush running on ground stainless steel axle. Castor loading capacity 200 tonne.

Pivoting castor with swivel head fitted with two EN24T single flange rail wheels complete with wheel brakes.
Tread diameter 280mm.
Tread width 87.5mm.
Tread flame hardened.
Maximum load rating per castor 45000Kg.

Applications and Examples

Bridge scraper for rectangular settlement tank

Steel double flange rail wheels SDF 450/80

Half Bridge scraper for rotary settlement tank

Both drive and trailing wheels standard polyurethane tyred wheels H300/75 bored and keywayed.

APPLICATIONS AND EXAMPLES

Wheels and axles supplied for the maintenance of dryer transfer cars for brick manufacturing plant. Brauer supplied complete wheel and axle assemblies that comprised Steel Double Flanged and Steel Flat Tread Wheels.

In addition to the application shown Brauer have been instrumental in the replacement of wheels and ongoing maintenance of several other key areas of the plant. The solutions provided have helped to solve certain irritating problems and removed unnecessary downtime on the production line resulting in considerable savings to the company.

Aggregate Screening Machine

Drum supported on four twin wheel axle assemblies each consisting of two polyurethane 'Press-on-Band' tyred wheels PH460/75 fitted to a modified BA75 axle assembly

Drum supported on four pivoting castors each fitted with two polyurethane tyred wheels H200/60.

Wheel options of Cast Iron, Steel or Aluminium
Vulkollan superior polyurethane is used as the standard tyre material. Tyres can be produced with crown/dome treads to suit specific applications.
Bore options available for all standard wheels fitted with precision bearings.
Operating temperature range -20C° to +60C°.
Hardness of tyre of 92 ±3° shore 'A'.

WHAT WE DO...

We offer a comprehensive design, engineering and manufacturing service to resolve your application problem either from our extensive range of standard products or products specifically designed for the application

- Wheels and castors designed to suit any environment.
- Computer aided design facilities include 3 dimensional feature based parametric solid modelling and finite element analysis.
- Life calculations for steel rail wheels.
- Non-standard wheels can often be designed from our extensive stock of castings, blanks, and part-machined and tyred wheels.
- Wheels, axle assemblies and castors can be designed and manufactured to suit any loading and in most materials including stainless steel, aluminium, titanium, nickel chromium alloys, etc.
- Polyurethane tyres can be bonded onto most metal centres including aluminium, titanium, stainless steel and various ferrous and non-ferrous alloys.
- Polyester/Polyether Polymeric tyre compounds can be produced in Naphthalene Diisocyanate (N.D.I), Toluene Diisocyanate (T.D.I) and Diphenylmethane Diisocyanate (M.D.I).
- All types of bearing and bushes can be incorporated into the design.
- Steel wheels and fabrications can be plated in blue or gold zinc passivation, cadmium, electroless nickel, chrome, etc. or finished to any paint specification.
- Non-destructive testing such as 'X' Ray, ultrasonic or magnetic particle detection is available on request.

Important Note

Whilst due care has been taken in compiling the following information, Brauer cannot guarantee its detailed accuracy, and will not accept responsibility for the results of use of any data which is subsequently found to be inaccurate.

1.0 Specification For Standard Wheels & Castors

1. Plain bore tolerances are +0.05 / -0 mm.
2. Standard tolerances on width and diameter ± 0.25 mm except tyred wheels which are ± 1.00 mm.
3. Wheels are fitted with grease nipples, other than plain bore keywayed wheels, nylon centred wheels, or wheels of 75, 100 or 125 diameter. Wheels fitted with ball journal bearings up to 40 mm bore may be without grease nipples if fitted with double shielded bearings.
4. Wheels of 75, 100 or 125 diameter fitted with ball journal bearings have pre-lubricated shielded bearings.
5. All wheels supplied with ball journals, other than those of 75, 100 or 125 diameter, have bearings with a single shield fitted to the outer side unless otherwise stated. Wheels fitted with ball journal bearings up to 40 mm bore may be fitted with double shielded bearings.
6. All wheels with ball or roller bearings, other than those fitted with pre-lubricated double shielded ball journals, are supplied un-greased to avoid contamination during shipment.
7. All wheels fitted with ball journals have a central spacer between the bearings to allow them to be clamped to an axle abutment shoulder without pre-loading the bearings.
8. Taper roller bearings are supplied with the outer race (cup) press fitted, and the inner cone and roller assembly, together with metal shields, supplied loose.
9. All cast wheels are finished in one coat self-etching black primer paint.
10. Fully machined wheels or axles from billet, or barstock, are protected by a coat of air-drying oil.
11. Pressed steel castor brackets are finished in bright zinc electroplating to BS1706.
12. Fabricated castor brackets are finished in one coat of self-etching black primer paint.
13. Keyways are produced to Wheels in house standard tolerances.

2.0 Untyred Wheels

When less than the full tread width is used to carry the load, the allowable load can be determined as follows:-

$$\text{Allowable load} = \frac{\text{Load carrying width}}{\text{Full tread width (per catalogue)}} \times \text{'Maximum Load Rating' (per catalogue)}$$

3.0 Rubber Tyred Wheels

3.1 LOAD RATING.

The 'Maximum Load Rating' given for each rubber tyred wheel is the maximum load the wheel will carry in constant use under the following conditions:

- | | |
|---|--|
| a) the wheel is free-wheeling (not driving) | d) the surface on which the wheel runs is flat and smooth (i.e steel or smooth concrete) |
| b) the ambient temperature is below 30 degrees C. | e) that the wheel is not steering or subjected to axial loads |
| c) the surface speed does not exceed 6 kph | f) no chemical is present which will attack rubber (see 3.2) |

For more severe conditions than those described above refer to Brauer for the allowable load, or consider polyurethane tyred wheels.

3.2 RESISTANCE TO CHEMICALS

A = little or no effect
B = moderate effect
C = severe effect

Acetic Acid 20%	C	Formaldehyde	C	Mineral oils	C
Acetone	C	Formic acid	B	Naphtha	C

Chloric Acid	D	Methanol (Methyl Alcohol)	B	Zinc Sulfate	A
Chlorine Water	C	Motor oil	A		

5.0 Polyurethane (Vulkollan) Tyred Wheels

5.1 LOAD RATING AND FACTORS

The 'Maximum Load Rating' given for each polyurethane tyred wheel is the maximum load the wheel will carry in intermittent use (a maximum of 1 hour running followed by a minimum of 1 hour at rest) under the following conditions:

- a) the wheel is free-wheeling (not driving)
- b) the ambient temperature is below 45 degrees C
- c) the surface speed does not exceed 6 k.p.h.
- d) the surface on which the wheel runs is flat and smooth (i.e steel or smooth concrete)
- e) that the wheel is not steering or subjected to axial loads
- f) no chemical is present which will attack polyurethane (see 5.2)

For more severe conditions the 'Maximum Load Rating' must be multiplied by the 'Load factor' as follows:

Condition	Load Factor
Continuous running	0.75
Surface Speed 6-10 kph	0.8
Surface Speed 10-16 kph	0.7
Driving wheels	0.7

For speeds over 16 kph, for operating temperatures over 45 degrees C and below 20 degrees C, for humid conditions, and for curved running surfaces (i.e. in supporting rotating drums) refer to Brauer Ltd for the allowable load.

Load factors must cumulate, for example:

A wheel with a 'maximum load rating' of 1000kg is to be subjected to continuous running at 8kph in a driving application,

$$\text{allowable load} = 1000\text{kg} \times 0.75 \text{ (continuous running factor)} \times 0.8 \text{ (speed factor)} \times 0.7 \text{ (driving factor)}$$

$$= 420\text{kg.}$$

6.0 Rail Wheels

6.1 APPROXIMATION OF ALLOWABLE LOAD FOR CATALOGUE ITEMS

The 'maximum Load Rating' given for each rail wheel (types CSF, SSF,CDF,CFT and SFT) is the maximum load the wheel can carry without permanent deformation and to give an acceptable service life when the full tread width is in contact with the rail.

In practice full contact with the rail across the tread width is rarely achieved due to

- Flange to rail clearance.
- Wheel overhang
- Rail corner radii

Allowable load capacities of catalogue items used on a given rail can be determined as follows:-

$$\text{Allowable Load} = \frac{\text{useable Rail width (per 6.2.4)}}{\text{full tread width (per catalogue)}} \times \text{maximum load rating (per catalogue)}$$

Note:

- The 'useable rail width' (per para 6.2.4) takes into account the profile of the rail head, whether convex or flat.
- The above applies to wheels with very light axial (flange) loads when fitted with bearings. Heavy axial loads will severely limit the radial load carrying capacity of the bearings – see 7.1
- 'Maximum Load Ratings' of catalogue items are based on $P_L = 0.52$, $C_1=1.1$, $C_2 = 0.9$ for steel wheels, and $P_L = 0.15$, $C_2 = 0.8$ for cast iron wheels - refer to 6.2 & 6.3 for relevant equations.

6.2 CALCULATION OF ALLOWABLE LOAD - STEEL OR S.G IRON RAIL WHEELS

The following equations can be used for wheels of up to 1.25m diameter of cast, rolled or forged steel, or S.G cast iron, to determine the relationship between:

- i) wheel diameter
- ii) ultimate strength of wheel material
- iii) load capacity
- iv) service life
- v) the useable width of the rail
- vi) speed of rotation of the wheel.

a) for the wheel to withstand the maximum static load to which it is subjected:

$$P_L \geq \frac{P_S \text{ mean}}{b \times D \times C_{1 \text{ max.}} \times C_{2 \text{ max.}}} = \frac{P_S \text{ mean}}{b \times D \times 1.38}$$

and

b) For the wheel to perform its specified duty without abnormal wear:

$$P_L \geq \frac{P_d \text{ mean}}{b \times D \times C_1 \times C_2}$$

- Where:
- D = wheel diameter (mm)
 - b = useable rail width (mm) – see 6.2.4
 - P_L = limiting pressure (kgf/mm²) – see 6.2.1
 - C_1 = a coefficient determined by r.p.m. – see 6.2.2
 - $C_{1 \text{ max.}}$ = 1.2
 - C_2 = a coefficient determined by ‘machine life and utilisation’ – see 6.2.3
 - $C_{2 \text{ max.}}$ = 1.15
 - $P_{S \text{ mean}}$ = the mean static load to be withstood by the wheel (kg)
 - = $\frac{2P_{S \text{ max.}} + P_{S \text{ min.}}}{3}$
 - $P_{d \text{ mean}}$ = the mean dynamic load to be withstood by the wheel (kg)
 - = $\frac{2P_{d \text{ max.}} + P_{d \text{ min.}}}{3}$

6.2.1 Determining the limited pressure P_L (as a function of the ultimate strength of the metal of which the rail wheel is made)

Notes:

- i) in the case of wheels heat treated to increase the surface hardness, the value of P_L is limited to that of the steel prior to surface treatment.
- ii) The ‘Limiting Pressure’ P_L is a notional pressure determined by supposing that the contact between wheel and rail takes place over a surface whose length is a diameter of the wheel, and width is the ‘useable rail width’ b.

P_L Kgf/mm ²	ULTIMATE STRENGTH OF METAL USED FOR RAIL WHEEL N/MM ² (SEE NOTE I)
0.50	500
0.56	600
0.65	700
0.72	800

6.2.2 Determining coefficient C_1

WHEEL ROTATIONAL SPEED, R.P.M.	C_1	WHEEL ROTATIONAL SPEED, R.P.M.	C_1	WHEEL ROTATIONAL SPEED, R.P.M.	C_1

Design Data

BRAUER®

6.2.3 Determining coefficient C₂ (machine life and utilisation)

Should a longer service life be required for a given material whose load/life properties have been determined per paragraph 6.2 refer to paragraph 6.4 'Surface Hardening'.

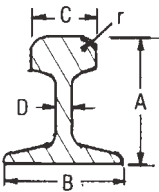

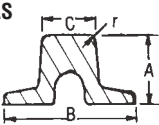

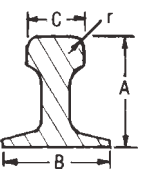

UTILISATION	SERVICE LIFE – HOURS							
	400	800	1600	3200	6300	12000	25000	50000
Mechanisms subjected very rarely to their maximum load and, normally, to very light loads	1.12	1.12	1.12	1.12	1.12	1.00	0.90	0.80
Mechanisms occasionally subjected to their maximum load, but, normally, to rather lighter loads	1.12	1.12	1.12	1.12	1.00	0.90	0.80	0.80
Mechanisms frequently subjected to their maximum load and, normally, to loads of medium magnitude	1.12	1.12	1.12	1.00	0.90	0.80	0.80	0.80
Mechanisms frequently or constantly subjected to their maximum load	1.12	1.12	1.00	0.90	0.80	0.80	0.80	0.80

6.2.4 Determining the useable rail width, b

The useable rail width is determined by the following equations:

- i) for convex topped rails $b \text{ (mm)} = C - \frac{4}{3} r$ (these are generally flat bottom rails) ii) for flat topped rails $b \text{ (mm)} = C - 2r$ (these are generally bridge, crane and barstock rails)

Dimensions and Useable Widths of a selection of rails are given below. These are for illustration only and details may deviate. Brauer recommend consulting the rail supplier for detailed cross section of rail selected before finalising the design of the wheel tread.

RAIL TYPE	RAIL SECTION IDENTITY	SECTION WEIGHT		PRINCIPAL DIMENSIONS (mm)					USABLE WIDTH b (mm)

ITEMS SHOWN IN BOLD ARE NORMALLY AVAILABLE FOR NEW BUILD

NOTE: Items with X are not manufactured by steel mills now.
Items in bold are at time of printing still currently manufactured.

DESIGN DATA

6.3 CALCULATION OF ALLOWABLE LOAD - CAST IRON RAIL WHEELS

While grey cast iron wheels are the most economic for light to medium duty, they are not suitable for high rotational speeds or where substantial shock loadings are to be withstood. Their performance is not as predictable as that of steel or S.G. iron wheels due principally to the presence of flake graphite which encourages 'spalling' of the surface.

6.3.1 Allowable Load - grey iron as cast

The relationship between:

- i) Wheel diameter
- ii) Load capacity
- iii) Useable rail width

Where:- D = wheel diameter (mm)
 b = useable rail width (mm) – see 6.2.4
 P_L = 0.15 (a conservative value to provide an acceptable service life)
 $C_{2\max}$ = 0.8

but **not** service life, can be approximated by the equation $P_L = \frac{P_{\max}}{b \times D \times C_{2\max}}$ P_{\max} = maximum load to be withstood by the wheel (kg)

6.3.2 Allowable Load - chilled cast iron or surface hardened cast iron

Chilling or surface hardening of cast iron refines and hardens the surface to give an economic wheel capable of carrying moderate loads, with a service life similar to that of comparable steel wheels. For cast iron wheels having a hardened surface, the equation for steels wheels applies (para 6.2) with a value $P_L = 0.50$

6.4 SURFACE HARDENING

Surface hardening can extend service life beyond that given in para 6.2.3. a guide to the relationship between surface hardness and service life being:

Note: The surface hardness of the wheel must be taken into account when selecting the rail.

SURFACE HARDNESS (Hv)	LIFE FACTOR (240 HV = 1)
240	1.0
280	1.7
320	2.0
360	2.2
400	2.3

6.5. FLANGE STRENGTH

An approximation of rail wheel flange strength sufficient for most purposes can be determined as follows:

$$\text{Allowable flange bending moment } M \text{ (Nmm)} = \frac{\sigma_{tu} \times 1.5 \times t_f^3}{6 \times N \times K_m \times K_c}$$

$$\text{Allowable flange load due to bending } P \text{ (kg)} = \frac{M}{9.81 \times e}$$

Note: Moments about bearings and axial loads on bearings due to flange loads must be taken into account when selecting bearings and axle/bearing arrangements -see 7.1

Where:

σ_{tu} = tensile strength of the wheel material (N/mm²)
 t_f = Flange thickness (mm)
 N = Flange safety factor (2.0 minimum recommended)
 K_m = load factor = 1.0 for gradually applied loads
 = 1.5 for suddenly applied loads
 K_c = casting factor (for cast wheels only) = 1.5
 e = dimension (mm) from tread to point of application of load P as shown;

7.0 Bearing and Seal Arrangements – Non Standard Wheels

7.1 SELECTION OF BEARINGS

The main considerations in the selection of bearings are:

- i) radial load
- ii) axial load
- iii) speed of rotation
- iv) bearing friction

In selecting ball or roller bearings it is important that the static and/or dynamic radial load rating requirement for each bearing should be determined taking into account a) the radial load. b) the radial equivalent or any axial load (as given in the bearing manufacturer's catalogue), and c) the radial load resulting from the moment of the axial load acting about the bearings.

It should be noted that in most bearing arrangements axial loads are taken by only one bearing, and that loads caused by condition c) above usually act positively on one bearing (being added to the radial load) and negatively on the other bearing (being deducted from the radial load).

DESCRIPTION	GENERAL ARRANGEMENT	RADIAL LOAD	AXIAL LOAD	SPEED OF ROTATION	BEARING FRICTION
1. Plain bronze or self-lubricating bushing		Very High	Very Light	Low	Moderate/High
2. Flanged bronze or self-lubricating bushing		Very High	High	Low	Moderate/High
3. Ball bearings		Light/Moderate	Light	High	Low
4. Opposed taper roller bearings		Moderate	Moderate	High	Low
5. Spherical roller bearings		High	Light/Moderate	High	Low
6. Spherical roller or cylindrical roller bearings and thrust washers or thrust bearings		High	Very High	High	Low
7. Needle roller bearings and thrust washers or thrust bearings		Very High	Very High	High	Low

7.2 BEARING SEALS

Bearing seals perform two main functions:

- i) To prevent the ingress of material which will affect the life of performance of the bearing,

and/or

- ii) To retain lubricant, particularly in hot or hostile environment.

Some typical sealing arrangements are illustrated:

DESCRIPTION	GENERAL ARRANGEMENT	APPLICATION NOTES
1. Bearings with seals and/or metal shields		Seals can be on one (outer) side only for lubrication via a grease nipple, or sealed both sides in 'sealed for life' applications. Seals of this type are not generally available for roller bearings.
2. Metal external shields		The simplest way of shielding roller or taper roller bearings, but without providing a complete seal.
3. Spring loaded lip seals		Provides excellent sealing. Spring should face outwards for grease renewal via a nipple and to prevent ingress of material, and inwards to retain lubricant in 'sealed for life' applications. Normal temperature range -40°C to +100°C.
4. Felt seals		Useful in high temperature applications in conjunction with suitable lubricants. Provide effective sealing of split housings.
5. 'O' ring seals		Can provide complete sealing, particularly against external pressure such as in underwater applications. Suitable only for circumferential surface speeds of less than 30m/min and temperatures of -40°C to +110°C.
6. Pressed steel labyrinth		Suitable only for 'sealed for life' applications as regreasing via a nipple tends to force the labyrinth out of its housing. Extra sealing can be obtained by inserting greased felt washers within the labyrinth during assembly.
7. Machined labyrinth		Can be used in conjunction with spring-loaded lip seals to provide the most effective seal in hostile environments.

8.0 Inertial and Rolling Resistance

The main forces resisting initial movement and acceleration of a wheeled vehicle are :

- i) the rolling friction between the wheel and the surface on which it rests and in the case of tyred wheels, the rolling resistance of the flat area of tread caused by static loading.
- ii) the friction within the wheel or axle bearings.
- iii) the inertial resistance of vehicle and load.

The main forces resisting the maintenance of movement after acceleration from rest are i) and ii) above (excluding the effect of a tyre 'flat')

8.1 ROLLING FRICTION

8.1.1 Polyurethane tyred wheels

Guide figures for rolling resistance per wheel as a percentage of load per wheel.

- i) from rest , when the period of rest is 8 hours maximum = 5% of load.
- ii) from rest, when the period of rest is greater than 8 hours = 8% of load.
- iii) to maintain a constant speed = 3% of load.

Note: these figures are approximations as they are influenced by such factors as ambient temperatures, the track surface, the load/rest cycle timing, wheel diameter etc.

8.1.2 Rail wheels

When a body rolls on a surface, the force resisting the motion is termed rolling friction.

The force required to overcome rolling friction of a rail wheel in constant motion is determined by the equation: $F = \lambda \times P$

Where: F = Force required to overcome rolling friction(kgf) per wheel.
 λ = Lambda, the coefficient of rolling friction.
 P = Load per wheel (kg).

8.1.2.1 Determining the coefficient of rolling friction λ

Contact Pressure (Hertz) Between Wheel and Rail (Kgf/mm ²)	Coefficient of Rolling Friction λ
30	0.005
40	0.007
50	0.008
60	0.010
70	0.012
80	0.013

The contact pressure (Hertz) between wheel and rail being determined by the equation

$$P_a = \frac{2 \times P}{\pi \times a \times b}$$

Where: P_a = Contact pressure (Hertz) in Kgf/mm²
 P = Load on wheel (kg)
 b = Useable rail width (mm) – see 6.2.4
 a = half the width of the 'plane contact zone' between wheel and rail

$$a = \sqrt{\frac{4 \times P \times R}{\pi \times E' \times b}}$$

Where: P = Load on wheel (kg)
 R = Radius of wheel (mm)
 b = Useable rail width (mm)
 E' = Effective Youngs Modulus of elasticity
 = 7470 Kg/mm² for an iron wheel on a steel rail
 = 11200 Kg/mm² for a steel wheel on a steel rail

8.2 BEARING FRICTION

For the purpose of determining the force required to start or maintain a wheel in motion the frictional resistance of ball or roller bearings, with their coefficient in the region of 0.002, can be disregarded.

The force required to overcome bearing friction for plain bearings is determined by the equation: $F = \frac{\mu \times P \times d}{D}$

Where: F = force required to overcome bearing friction(kg)
 μ = The coefficient of friction
 P = load on wheel (kg)
 d = diameter of axle (mm)
 D = diameter of wheel (mm)

The table gives guide figures for the coefficient of friction μ for rolling bearings and for various plain bearing materials running on a smooth steel axle.

The lubricated coefficient should be used for wheels in motion, and the unlubricated coefficient for wheels starting from a period of rest under static load (which assumes the worst condition)

Bearing Material	Coefficient of Friction μ	
	Lubricated	Unlubricated
Cast iron	0.21	0.40
Bronze	0.16	0.35
Thin wall PTFE/Lead wrapped bushes	0.02 - 0.20	0.02 - 0.20

8.3 INERTIAL RESISTANCE

To calculate the force required to accelerate the mass of the vehicle and its load from rest with a uniform rate of acceleration on a level track:

i) when the time taken to achieve the final velocity is known $F = \frac{M \times V_f}{t \times g}$

or, ii) when the distance taken to achieve the final velocity is known $F = \frac{M \times V_f^2}{2 \times s \times g}$

Where: F = force required to overcome inertia (kg)
 M = total mass of vehicle and load (kg)
 V_f = final velocity (m/sec)
 t = time taken to achieve final velocity from rest (secs)
 s = distance taken to achieve final velocity from rest (m)
 g = force of gravity = 9.81 m/sec²

9.0 Traction – Coefficient of Friction

The traction of a driving wheel = $\mu \times P$

Where: μ = the coefficient of friction for a given wheel material and track surface.
 p = the load of the wheel.

Guides values for coefficients of friction μ , for wheel and tyre materials in contact with various surfaces are given:

Surface	Wheel or Tyre Material				
	Rubber	Polyurethane	Steel	Cast Iron	Nylon
Dry Steel	0.8	0.7	0.6	0.4	0.4
Wet Steel	0.5	0.4	0.4	0.3	0.15
Dry Smooth Concrete	0.8	0.7	–	–	–
Wet Smooth Concrete	0.5	0.6	–	–	–
Dry Rough Concrete	1.0	0.8	–	–	–
Wet Rough Concrete	0.9	0.6	–	–	–
Ice	0.1	0.1	0.02	0.02	–

10.0 Load Calculations For Wheels Supporting and/or Driving Rotating Drums.

In installations where support wheels drive the drum we recommend that the driving wheels be positioned on the upwardly rotating side of the drum (as shown below) which is the more heavily laden side.

To determine the required 'Maximum Load Rating' for wheels at each support position for the purpose of wheel selection:

$$\text{Maximum Load Rating – Drive Wheel} = \frac{(0.5P_1) + P_2}{\text{Cos } \alpha \times L \times L_S \times L_C}$$

$$\text{Maximum Load Rating – Idler Wheel 1} = \frac{0.5(P_1 + P_2)}{\text{Cos } \alpha \times L_S \times L_C}$$

$$\text{Maximum Load Rating – Idler Wheel 2} = \frac{(0.5P_1) + P_2}{\text{Cos } \alpha \times L_S \times L_C}$$

Where: P_1 = weight of the drum at the support position under consideration (kg)
 P_2 = weight of the contents at the support position under consideration (kg)
 L = 0.7 = Load factor for driving wheels (polyurethane tyred wheels only)
 L_S = Load factor according to drum surface speed – see 5.1 (polyurethane tyred wheels only)
 L_C = 0.75 = Load factor for continuous running - see 5.1 (polyurethane tyred wheels only)

11.0 Keyway Dimensions – Parallel Key

Generally - (to commercial tolerances – keyways to BS46: part 1: 1958 and BS4235: part 1: 1972 available to order)

13.0 Castors

13.1 EXAMPLES OF POSSIBLE CASTOR ARRANGEMENTS

2 Swivel Castors and 2 Fixed Castors

Providing good load capacity and manoeuvrability, this arrangement ensures accurate steering, even on long straight runs, making it the most practical arrangement for industrial use. Any trolley with this castor arrangement should be pushed with the fixed castors leading.

$$\text{Maximum loading for each castor} = \frac{\text{Gross load}}{3}$$

4 Swivel Castors

As this arrangement gives good load capacity with exceptional manoeuvrability, it is suitable for winding runs and where sideways action is required. It is not recommended for straight runs or ramps, as it may be hard to guide, especially over bumpy terrain and when heavily loaded. **However, equipping two castors with directional locks makes this arrangement very versatile and suitable for long straight runs.**

$$\text{Maximum loading for each castor} = \frac{\text{Gross load}}{3}$$

1 Swivel Castor and 2 Fixed Castors

This arrangement provides an economical solution for lightly loaded trolleys requiring good manoeuvrability. The trolley must be reasonably small in size and any load must be evenly distributed to ensure stability.

$$\text{Maximum loading for each castor} = \frac{\text{Gross load}}{2.5}$$

2 Swivel Castors and 2 Fixed Castors centrally pivoting

Ideal for confined spaces, this arrangement provides good load capacity with excellent manoeuvrability. The fixed castors can be replaced by an 'A' series axle assembly (see page 87) and wheels which pivot the trolley centrally. In this case, 25mm of packing is necessary above the two fixed castors (wheels) to give alternating load support. However if the trolley is tipped or the load is not evenly distributed, the swivel castors are subjected to shock loads.

The entire load rests on the two central, fixed castors/wheels.

$$\text{Maximum loading for each wheel/castor} = \frac{\text{Gross load}}{2}$$

4 Swivel Castors and 2 Fixed Castors centrally pivoting

This arrangement provides an extremely high load capacity, with great manoeuvrability and stability. This is ideal for very long trolleys designed to carry heavy loads – the fixed castors can be replaced by wheels mounted onto a central 'A' series axle (see page 87). The unit's base must be robust and the swivel castors are mounted to allow the trolley to pivot on the central wheels. Therefore, 25mm of packaging is required above the two fixed castors (wheels) to give alternating load support, depending on which pair of wheels is in contact with the floor. The entire load rests on 2 central, fixed castors/wheels.

Please note that the swivel castors are subjected to shock loads if the trolley is tipped or the load is not evenly distributed.

$$\text{Maximum loading for each wheel/castor} = \frac{\text{Gross load}}{2}$$

3 Swivel Castors

This provides good load capacity with excellent manoeuvrability. However, equipment with this arrangement will be difficult to guide on straight runs particularly over uneven ground.

This arrangement is ideal for barrel dollies and small portable machines.

$$\text{Maximum loading for each wheel} = \frac{\text{Gross load}}{2.5}$$

2 Fixed Castors and 2 Fixed Castors centrally pivoting.

Suitable for moderate loads and long, straight runs with occasional changes in direction.

The two central fixed castors can be replaced by wheels mounted onto a central 'A' series axle (see page 87). The two end castors are mounted as to pivot the trolley centrally.

25mm of packing is necessary above the two central castors (wheels) to give alternating load support. However if the trolley is tipped or the load is not evenly distributed, the end castors are subject to shock loads. The entire load rests on the 2 central, fixed castors/wheels.

$$\text{Maximum loading for each wheel/castor} = \frac{\text{Gross load}}{2}$$

13.1.2 Correct alignment of castors

- Fixed and directional lock swivel castors - the mounting holes in the top plates are clearance holes and it is essential to align the castors correctly before the bolts are finally tightened.
- Swivel castors - it is essential they are mounted with the swivel axis vertical

13.1.3 Important Note The formulae above for the maximum loading for each castor is for an equally distributed load.

13.2 LOAD RATING

13.2.1 Limitations to stated maximum load rating for each model number:-

- Untyred wheels - refer to design data para 2.0
- rubber tyred wheels - refer to design data para 3.0
- Polyurethane tyred wheels - refer to design data para 5.0

13.2.2 Floor conditions

The stated maximum load rating for each model assumes that the floor is reasonably level and free from cracks, obstructions, guide rails, gullies etc.

If any of the above are present in the operating environment then a castor with a load rating several times greater than calculated must be used. In addition the wheel diameter must be large enough to easily pass over any cracks, ridges and other obstructions.

13.3 MANUAL PROPULSION

The generally accepted effort an average human is capable of exerting is:-

- 18 Kgf for moving from a standing start
- 12 Kgf for a short distance once in motion
- 6 Kgf for longer distances on travel

For inertial and rolling resistance, refer to design data para 8.0 and for traction design data para 9.0

13.4 POWER TOWING

Obstructions such as kerbs and gullies and even relatively small steps, can exert enormous impact loads which can damage a castor. Steps such as lift sills, drains covers and joints in concrete slabs, present a particular problem if they are not approached squarely and at low speeds. Approaching such obstacles obliquely makes the castor turn at right angles to the obstruction instead of turning in such a way that it can climb over it, this damages the castor.

Towing trailers in train increases the problem as only one castor may have to withstand the force generated by the mass of the whole train including the tractor.

When towing trailers in train the diagram below illustrates the position of the pin couplings relative to the rear fixed castors to ensure the weight of the trailer and its contents are evenly distributed between the front swivel castors and rear fixed castors as well as ensuring good tracking.

WHEELS AND AXLE ASSEMBLIES

Part Numbering Brauer wheels have descriptive part numbers as shown by the following example:

BEARING TYPES	
BJ	= Ball Journal
TB	= Taper Roller
CRB	= Cylindrical Roller
SPHBR	= Spherical Roller
PB	= Plain bore
K	= Keyway
SL	= Self lubricating bush

Non-catalogue items use the same descriptive part numbering system prefixed by the word specified, abbreviated as "spec".

Steel Single Flanged Rail Wheels

MATERIAL: Steel to BS970: Part 1: 1983: 080M40

OPERATING TEMPERATURE RANGE:

Plain bored or keywayed wheels – 30°C to 350°C

Ball or taper roller bearinged wheels – 40°C to 120°C

The 'maximum load rating' given for each wheel is based on the full tread width being in contact with the rail. Working loads must be calculated based on the useable rail width and operating conditions – see 'Design Data' paras. 6.1. and 6.2.

Standard wheel features a 3° tread angle to assist centering of pairs of wheels on common axles when used with convex crown rails. When single flanged wheels are to be used singly or on flat topped rails, 'flat treads', (which have the tread parallel to the wheel axis and flanges at a 5° angle) should be specified by adding suffix 'FT' to the part number. (Tread diameter may be reduced)

Alternative bore/bearing diameters and alternative bearing types (i.e. bronze bushes, self-lubricating bushes, roller bearings, spherical roller bearings, etc.) are available to order – see pages 26-27.

Plain bore wheels are not drilled and tapped for greasing unless requested at time of order.

For technical information covering load factors, inertial and rolling resistance, coefficients of friction between wheel and track, and keyway dimensions, see "Design Data" Index on page 20.

**WHEEL TYPE:

STEEL SINGLE FLANGED RAIL

Cast Iron Single Flanged Rail Wheels

Cast iron rail wheels are the most economic for light to medium duty, but they have a limited service life when compared to steel wheels, and are unsuitable for high rotational speeds or where substantial shock loads are to be withstood.

MATERIAL: Cast iron to BS1452: 1977: Grade 200

The 'maximum load rating' given for each wheel is based on the full tread width being in contact with the rail. Working loads must be calculated based on the useable rail width and operating conditions – see 'Design Data' paras. 5.1. and 5.3.

OPERATING TEMPERATURE RANGE:

- Plain bored or keywayed wheels – 30°C to 250°C
- Ball or taper roller bearing wheels – 30°C to 120°C

Standard wheel features a 3° tread angle to assist centering of pairs of wheels on common axles when used with convex crown rails. When single flanged wheels are to be used singly or on flat topped rails, 'flat treads', (which have the tread parallel to the wheel axis and flanges at a 5° angle) should be specified by adding suffix 'FT' to the part number. (Tread diameter may be required)

Alternative bore/bearing diameters and alternative bearing types (i.e. bronze bushes, self-lubricating bushes, roller bearings, spherical roller bearings, etc.) are available to order – see pages 26-27.

For technical information covering load factors, inertial and rolling resistance, coefficients of friction between wheel and track, and keyway dimensions, see "Design Data" Index on page 20.

Steel Double Flanged Rail Wheels

Flanged wheels can be used for guidance paired with an unflanged rail wheel to allow a wide tolerance in the pitch of the rails.

MATERIAL: Steel to BS970; Part I: 1983: 080M40

OPERATING TEMPERATURE RANGE:

- Plain bored or keywayed wheels – 30°C to 350°C
- Ball or taper roller bearinged wheels – 30°C to 120°C

The 'maximum load rating' given for each wheel is based on the full tread width being in contact with the rail. Working loads must be calculated based on the useable rail width and operating conditions – see 'Design Data' paras. 6.1. and 6.2.

Alternative bore/bearing diameters and alternative bearing types (i.e. bronze bushes, self-lubricating bushes, roller bearings, spherical roller bearings, etc.) are available to order – see pages 26-27.

Plain bore wheels are not drilled and taped for greasing unless requested at time of order.

For technical information covering load factors, inertial and rolling resistance, coefficients of friction between wheel and track, and keyway dimensions, see "Design Data" Index on page 20.

CAST IRON FLAT TREAD RAIL

Cast Nylon Flat Tread Rail Wheels

Nylon wheels are light in weight and are resistant to impact, abrasion, corrosion and the effect of many chemicals.

While unflanged wheels can be used to run on surfaces such as concrete or steel plate, their most common application is paired with a double flanged wheel, the flanged wheel providing guidance and the unflanged wheel allowing a wide tolerance in the pitch of the rails.

MATERIAL: Cast Nylon 6

OPERATING TEMPERATURE RANGE:

Plain bored or keywayed wheels – 30°C to 80°C

Ball or taper roller bearinged wheels – 30°C to 80°C

The 'maximum load rating' given for each wheel is based on the full tread width being in contact with the rail. Working loads must be calculated based on the useable rail width and operating conditions – see 'Design Data' paras. 6.1. and 6.2.

Alternative bore/bearing diameters and alternative bearing types (i.e. bronze bushes, self-lubricating bushes, roller bearings, spherical roller bearings, etc.) are available to order – see pages 26-27.

Plain bore wheels are not drilled and tapped for greasing unless requested at time of order.

For technical information covering load factors, inertial and rolling resistance, coefficients of friction between wheel and track, and keyway dimensions, see "Design Data" Index on page 20.

STEEL 'V' GROOVED

Polyurethane Tyred Single Flanged Rail Wheels

Standard wheel features flanges with a 5° angle and a 'flat tread' (ie tread parallel to the wheel axis) for running on flat top rail. Polyurethane is resilient, durable material, resistant to abrasion and to many common chemicals. Polyurethane tyred wheels are capable of carrying heavy loads and of transmitting driving forces.

MATERIAL: Wheel Centre - Steel to BS970: Part 1: 1983: 080M40
Tyre - Polyester Based Polymer of 92° ± 3° Shore A Hardness

OPERATING TEMPERATURE RANGE:
-20°C to + 60°C (115°C for limited use)

PLEASE SPECIFY IF OPERATING IN HIGH HUMIDITY.

Anti-hydrolysis polyurethane is recommended for use in an operating environment of high humidity.

Polyurethane to the above hardness used on these wheels is Vulkollan, a high quality material that provides superior performance in most applications.

Should the mechanical properties of Vulkollan be inappropriate for the application, alternative grades of Polyurethane can be produced to meet the requirements. Polyurethane can be bonded onto most metal centres including aluminium, titanium, stainless steel and various ferrous and non-ferrous alloys.

The 'Maximum Load Rating' given for each wheel assumes the full tread width is in contact with the rail. In practice full contact with the rail across the tread width is rarely achieved due to:-

- a) Flange to rail clearance
- b) Wheel Overhang
- c) Rail Corner Radii

For calculation of the 'Maximum Allowable Load' see 'Design Data' Para 6.1

In addition the 'Maximum Load Rating' given for each wheel is for operation under ideal conditions.

Load factors must be applied according to the anticipated working conditions - see 'Design Data' Para 5.1

Alternative Bore/Bearing diameters and alternative bearing types (i.e) bronze bushes, self lubricating bushes, etc.) are available to order - see page 26-27.

For technical information covering load factors, inertial and rolling resistance, chemical resistance, coefficients of friction between wheel and track and keyway dimensions, see 'Data Design' index on page 20.

POLYURETHANE TYRED SINGLE-FLANGED

WHEEL TYPE:
SFH100/40

POLYURETHANE TYRED SINGLE-FLANGED

Single Flanged 'I' Beam & Channel Wheels - Flat Tread

Brauer has added a flat version to its popular "I" beam and channel radiused tread and wheel range. The new steel, **flat tread**, single flanged range is designed to suit parallel flanged channels and universal beams (to BS4, Part I 1993). The axles have been significantly upgraded to increase the load carrying capacity of the assembly.

MATERIAL: Steel to BS970: Part 1: 1983: 080M40

OPERATING TEMPERATURE RANGE:

-30°C to 120°C.

When shock loadings are to be withstood the 'maximum load rating' should be reduced by multiplying by a shock loading factor of 0.65.

SINGLE FLANGED 'I' BEAM & CHANNEL

PART NUMBER:
SSFF55/25/BJA

Maximum load rating:
370Kg

See pages 23-26 for load factors

See pages 23-26 for load factors
Approximate weight: 4Kg

Single Flanged 'I' Beam & Channel Wheels - Radius Tread

BRAUER[®]

The SFR (cast iron) and SSFR (Steel) ranges of wheel assemblies have been designed to fit within standard sections of channel and 'I' beams. The radiused tread accommodates the angle of the section and improves the wear and tracking characteristics.

MATERIAL: SFR series – Cast iron to BS1452: 1977: Grade 200
 SSFR series – Steel to BS970: Part 1: 1983: 080M40
 Axles – Steel to BS970: Part 1: 1983: 606M36 or 605M36

OPERATING TEMPERATURE RANGE:
 -30°C to 120°C.

SFR (cast iron) wheels are not suitable where substantial shock loads are to be withstood, and they have a limited service life in comparison with the equivalent SSFR wheel.

When shock loadings are to be withstood by either the SFR or SSFR ranges the 'maximum load rating' should be reduced by multiplying by a shock loading factor of 0.65.

SINGLE FLANGED 'I' BEAM & CHANNEL

RAIL SECTION

RAIL

- For correct selection of rail-clips, please contact Brauer Sales department.
- Conventional rail section can be 'fish-plated' or welded. Bridge & Crane rail, welded, butted or 45° taper (joined) then clipped.
- Gauge tolerance is not set to a standard but $\pm 3.00\text{mm}$ should be considered.
- Do not drill foot of rail as it weakens the section: use the correct rail-clips specified by Brauer.
- CES2:1987; is the British steel rail standard.
- Gauge means distance between (G) "Gauge"

- Clips should normally be set approximately 60-70 cm pitch as a recommendation

Rail sections are now available to offer complete solutions for customer requirements. Advice on fixing components and matching rail to wheels are available on request.

Untyred wheels can carry high loads with low rolling resistance when used on a hard surface such as flat steel. On softer surfaces, such as concrete or tarmac, the surface is likely to be worn or indented by the use of an untyred wheel. Untyred wheels are noisier in operation than tyred wheels, but noise is unlikely to be a problem at walking speeds.

MATERIAL: Cast iron to BS1452: 1977: Grade 200.

OPERATING TEMPERATURE RANGE:

- Plain bored or keywayed wheels – 30°C to 250°C
- Ball or taper roller bearinged wheels – 30°C to 120°C

Alternative bore/bearing diameters and alternative bearing types (i.e. bronze bushes, self-lubricating bushes, roller bearings, spherical roller bearings, etc.) are available to order – see page 26-27.

For wheels of larger diameter or greater load capacity see the CFT series (pages 48 & 49) and SFT series (pages 45-47).

For technical information covering load factors, inertial and rolling resistance, coefficients of friction between wheel and track, and keyway dimensions, see “Design Data” Index on page 20.

Drawings show grease nipple but standard wheels do not come with grease nipple unless specifically requested.

CAST IRON UNTYRED

WHEEL TYPE:
C75/40

See table for full part number

Maximum load rating:
400Kg

See page 23-26 for load factors

Approximate weight: 0.75Kg

CAST IRON UNTYRED

Brauer HEAVITHANE™ Polyurethane is resilient, durable material, resistant to abrasion and to many common chemicals. Polyurethane tyred wheels are capable of carrying heavy loads and of transmitting driving forces.

MATERIAL: Wheel centre – cast iron to BS1452: 1977: Grade 200 or steel to BS970: Part 1: 1983: 080M40.
Tyre – Polyester based polymer of 92± 3° A Shore hardness.

OPERATING TEMPERATURE RANGE:
-20°C to +60°C (115°C for limited use)

PLEASE SPECIFY IF OPERATING IN HIGH HUMIDITY.

Anti-hydrolysis polyurethane is recommended for use in an operating environment of high humidity.

Polyurethane to the above hardness used on these wheels is Vulkollan, a high quality material that provides superior performance in most applications.

Should the mechanical properties of standard Vulkollan be inappropriate for the application, alternative grades of Polyurethane can be produced to meet the requirements. Polyurethane can be bonded onto most metal centres including aluminium, titanium, stainless steel and various ferrous and non-ferrous alloys.

The 'maximum load rating' given for each wheel is for operation under ideal conditions. Load factors must be applied according to the anticipated working conditions – see 'Design Data' para. 5.1.

For wheels of larger diameter or greater load capacity see the PH series on pages 78-81. Alternative bore/bearing diameters and alternative bearing types (i.e. bronze bushes, self-lubricating bushes, roller bearings, spherical roller bearings, etc.) are available to order – see page 26-27.

For technical information covering load factors, chemical resistance, inertial and rolling resistance, coefficients of friction between wheel and surface, and keyway dimensions, see "Design Data" Index on page 20.

Drawings show grease nipple but standard wheels do not come with grease nipple unless specifically requested.

Tyres can be produced with crown/dome treads to suit specific applications.

ALLOWABLE LOADS @ 6KPH

POLYURETHANE TYRED

Temperature range of operation -40° to +85°C. The polyurethane is non-marking, with high resistance to axial loading, and runs quietly. Used in conveyor applications, systems of transporting products along material handling systems or in areas of support for hanging structures or components, as found in;

- escalators
- sorting
- overhead conveyors
- conveyors for letter & mail
- baggage handling airport equipment

Higher load capacity than Vulkopan, due to the chemical bonding and therefore far more resistant to axial forces. 92° shore hardness guarantees higher levels of elasticity and damping & improved traction. Finally, Vulkollan unlike Vulkopan can be machined after setting for specific tolerancing.

Polyurethane 'Press-on Band' Tyred Wheels

Unlike the less expensive polyurethane tyred wheels shown on pages 68-73 which have the tyre bonded directly to the wheel centre, 'Press-on Band' wheels have the tyre bonded to a thin steel band which is press-fitted to the wheel centre allowing the tyre to be replaced when worn.

MATERIAL: Wheel centre – cast iron to BS1452: 1977: Grade 200 or steel to BS970: Part 1: 1983: 080M40
Tyre – Polyester based polymer of $92 \pm 3^\circ\text{A}$ Shore hardness.

OPERATING TEMPERATURE RANGE:
-20°C to +60°C (115°C for limited intermittent use).

PLEASE SPECIFY IF OPERATING IN HIGH HUMIDITY.
Anti-hydrolysis polyurethane is recommended for use in an operating environment of high humidity.

Polyurethane to the above hardness used on these wheels is Vulkollan, a high quality material that provides superior performance in most applications.

Should the mechanical properties of Vulkollan be inappropriate for the application, alternative grades of Polyurethane can be produced to meet the requirements. Polyurethane can be bonded onto most metal centres including aluminium, titanium, stainless steel and various ferrous and non-ferrous alloys.

The 'maximum load rating' given for each wheel is for operation under ideal conditions. Load factors must be applied according to the anticipated working conditions – see 'Design Data' para. 5.1.

Alternative bore/bearing diameters and alternative bearing types (i.e. bronze bushes, self-lubricating bushes, roller bearings, spherical roller bearings, etc.) are available to order – see page 26-27.

For technical information covering load factors, chemical resistance, inertial and rolling resistance, coefficients of friction between wheel and track, and keyway dimensions, see "Design Data" Index on page 20.

Drawings show grease nipple but standard wheels do not come with grease nipple unless specifically requested.

Tyres can be produced with crown/dome treads to suit specific applications.

POLYURETHANE 'PRESS-ON-BAND'

Rubber tyred wheels are the least expensive type of tyred wheel and are suitable for moderate loads. They are quiet in operation and protect the surface on which they run, although they can cause marking. Rubber tyres can generate static electricity, and where this is undesirable, 'anti-static' tyres can be specified.

MATERIAL: Wheel centre-cast iron to BS1452: 1977: Grade 200.

Tyre-carbon black reinforced natural rubber compound of 85±5°A Shore hardness.

OPERATING TEMPERATURE RANGE:

0°C to 50°C.

The 'maximum load rating' given for each wheel is for operation under ideal conditions. Load factors must be applied according to the anticipated working conditions – see 'Design Data' para. 3.1.

Alternative bore/bearing diameters and alternative bearing types (i.e. bronze bushes, self-lubricating bushes, roller bearings, spherical roller bearings, etc.) are available to order – see page 26-27.

For technical information covering load factors, inertial and rolling resistance, coefficients of friction between wheel and surface, and keyway dimensions, see "Design Data" Index on page 20.

Drawings show grease nipple but standard wheels do not come with grease nipple unless specifically requested.

Nylon Wheels

BRAUER[®]

Plain untyred nylon wheels are the least expensive type of wheel. They are light in weight, and are resistant to impact, abrasion, corrosion, and the effect of many chemicals. They can be fitted with bearings but are most often used with their nylon bores running on a smooth steel axle. No lubrication is necessary, but they will benefit from being oiled. Having little resilience they tend to be noisiest when moving quickly over rough surfaces, and they can mark floors if highly loaded.

OPERATING TEMPERATURE RANGE: 5°C to 40°C
(-20°C to 80°C for limited use).

Nylon wheels are resistant to oils fats, alkalis in general, soaps and detergents but should not be used in contact with acids.

COMPRESSION LOAD IN THIS DIRECTION (1)

This series of four sizes of malleable cast iron axle brackets feature machined bores, bosses and mounting faces.

The brackets are slotted through one mounting hole, allowing the bracket to be positioned by bolting through the solid side, and the axle to be positioned laterally before being clamped by tightening the bolt through the slotted side.

MATERIAL: S.G. Cast Iron to BS2789: 1985: 420/12.

APPROXIMATE WEIGHTS:

B1 SERIES 1.3Kg B2 SERIES 2.3Kg

(1) The 'maximum load rating' applies with the bracket in compression as shown.

'A' Series Axle Assemblies

BRAUER[®]

These axle assemblies are for mounting pairs of wheels fitted with ball or roller bearings, the lock nuts and washers, or self locking nuts providing adjustment for opposed taper roller bearings.

Axle diameter 'A' and dimension 'D' should be selected to match the bearing bore and hub width of the wheels to be fitted.

The slotted axle brackets allow lateral positioning of the axle and wheels for alignment on installation – see "Axle Brackets" on page 86.

The assembly is supplied complete with axle brackets, bearing retaining/adjustment nuts, and locking washers.

AXLE MATERIAL:

Steel to BS970: Part 1:
1983:606M36 or 605M36.

**** Denotes dimension between bearing abutment shoulders in mm to be specified by the customer.

* The 'Maximum Load Rating' applies per axle:

- i) to gradually applied loads. For shock loads multiply by a 'shock loading factor' of 0.65.
- ii) to radial loads only. Where axial loads are to be applied in conjunction with radial loads, refer to HMC-Brauer for allowable loads.
- iii) with axle brackets positioned within 'dimension E'.

'A' SERIES AXLE ASSEMBLIES

The 'BA' series axle assemblies are for mounting single wheels fitted with ball or roller bearings, the lock nut, lock washer, or self locking nuts and sleeve providing adjustment for opposed taper roller bearings.

Axle diameter 'A' and dimension 'D' should be selected to match the bearing bore and hub width of the wheels to be fitted.

The slotted axle brackets, in conjunction with the extended major axle diameter and sleeve (dimension 'C') allow a wide tolerance in the positioning of the brackets, and also allows the wheel to be positioned laterally between the brackets – see "Axle Brackets" on page 86.

The assembly is supplied complete with axle brackets, bearing retaining/adjustment nut and locking washer.

AXLE MATERIAL:

Steel to BS970: Part 1: 1983: 606M36 or 605M36.

'CA' Series Axle Assemblies

This range of cantilevered stub axles is designed to mount single wheels with ball or roller bearings, the lock nut and lock washer, or self locking nuts providing adjustment for opposed taper roller bearings.

Axle diameter 'A' and dimension 'D' should be selected to match the bearing bore and hub width of the wheel to be fitted.

The assembly is supplied complete with bearing retaining/adjustment nut and locking washer, and a pair of half nuts for mounting.

AXLE MATERIAL:

Steel to BS970: Part 1: 1983: 606M36 or 605M36.

- ii) to radial loads only. Where axial loads are to be applied in conjunction with radial loads, refer to HMC-Brauer for allowable loads.

'CA' SERIES AXLE ASSEMBLIES

PART NUMBERING Castors have descriptive part numbers as shown by the following example:

BEARING TYPES	
BJ	= Ball Journal
TB	= Taper Roller
CRB	= Cylindrical Roller
PB	= Plain Bore
SL	= Self Lubricating Bush
OPTIONAL FEATURES	
D	= Directional Lock
W	= Wheel Lock
T	= Thread Guard
B	= Footbrake
F	= Swivel & Wheel Lock
X	= Wheel Brake
S	= Head Seal

Non-catalogue items use the same descriptive part numbering system prefixed by the word specified, abbreviated as "spec".

Pivoting Castors

Load rating up to and exceeding 200 Tonne

Pivoting Castors generally consist of a pair of wheels rotating about a central axis.

A pair of wheels on a castor enable a lower overall height to be achieved compared to a single wheel castor of identical load capacity. The pivoting design ensures that the load is equally distributed over both wheels should the running surface be slightly uneven. This prevents overload on the wheels, a common problem with conventional twin wheel castor assemblies.

Multi-pivoting designs are used to spread the load over more than just one wheel which is not only beneficial for wear and lifetime working, but which also has the added advantage of reducing the overall height of a single wheel design.

These castors are designed to suit individual applications and can be supplied with stress analysis graphs using finite element analysis for the castor frame.

Brauer has many years experience in the design and manufacture of such assemblies with load ratings up to and exceeding 200 tonne. If you have a requirement simply fill in the design data sheet on page 19 and send it to our Sales team, alternatively email us as below.

PIVOTING CASTORS

Pneumatic Tyred Castor Single Wheel

- High speed applications (up to 10Kph)
- Multi-terrain operation capability
- Option for bespoke applications
- Incorporates reliability of WG swivel mechanism
- Brauer build quality assured
- Often adapted for towing applications

This new product further enhances the range of castors offered by Brauer designed to meet applications which have high load and speed requirements, such as freight handling and cargo dollies. The swivel and horn plates utilise our tried and tested WG castor range to give a reliable product with durability and strength.

WHEEL FACE BRAKE OPTION
- SUFFIX 'WFB'

PNEUMATIC TYRED SINGLE WHEEL

Pneumatic Tyred Castor Twin Wheel

- High speed applications (up to 10Kph)
- Multi-terrain operation capability
- Option for bespoke applications
- Incorporates reliability of TQZ swivel mechanism
- Brauer build quality assured
- Often adapted for towing applications

This new product further enhances the range of castors offered by Brauer designed to meet applications which have high load and speed requirements, such as freight handling and cargo dollies. The swivel and horn plates utilise our tried and tested TQZ castor range to give a reliable product with durability and strength.

PNEUMATIC TYRED TWIN WHEEL

The UHQZ, HQZ, TQZ, QZ, WG, TWG, GG and LG are made from precision machined components to ensure a long and trouble-free life, even under the most severe operating conditions.

DESIGN FEATURES

Precision hardened and ground ball thrust race ensures a smooth and free swivel action under heavy loads.

A swivel seal retains the grease which is packed on assembly and prevents the ingress of dirt or water.

A precision taper-roller bearing reacts to bending loads on the castor.

A self locking nut is adjusted on assembly to remove free play and to tightly pre-load the swivel bearings.

Steel top plate/king-post provides accurate alignment of the bearings and reliable strength.

Optional Directional Lock (locks in 4 positions 90° apart – add suffix D to the Part Number)

The taper roller bearing is shielded to retain grease and to prevent the ingress of dirt.

Optional Wheel Lock (Available on selected swivel and fixed castors - add suffix W to the Part Number)

Precision bearings fitted as standard

UHQZ Series

Swivel load rating 12000kg

WITH A VARIETY OF WHEEL OPTIONS (SEE TABLE BELOW)

SWIVEL

Note: Steel Wheel option shown

Top plates have fixing holes to suit 16mm diameter bolts

Swivel top plate thickness 50mm (G)

Fixed top plate thickness 25mm (H)

2) Options F – swivel radius of brake pedal 178mm

OPTIONS AVAILABLE

NOTE: Also available with other wheel types.

WHEEL LOCK (W)
Swivel castors only, not available for 100mm dia. wheel

A simple hand operated parking lock

Add suffix W to part number

SWIVEL AND WHEEL LOCK (F)
Swivel castors only 125-300mm only

The foot pedal clamps a spring across the wheel & swivel, locking them both

Add suffix F to part number

DIRECTIONAL LOCK (D)
Swivel castors only

A four-station plunger lock converting swivel castors into fixed for straight line travel

Add suffix D to part number

H SERIES CASTORS

Light Duty Castors F Series

Swivel load rating 380kg

E SERIES CASTORS

Jacking Units

JBG Series

Load rating 600kg

Brauer has designed and developed a range of four jacking units, which now cover the full loading spectrum for jacking unit use, where lifting by raising a trailer, flat bed or trolley bed on castors or without castors (flat footed) to align with a docking area, is required. The family consist of the lighter loaded JBG series which has a capacity of 600Kg right up to the heavy duty JWG series with loading capacities of 2500Kg per jacking unit. Quality, design and availability are enhanced, as all four of the Brauer jacking units are made at our Milton Keynes facility. The JBG has been designed to suit our HA castor range which has wheel options, from 125mm to 200mm diameter and uses an aluminium centred wheel with a polyurethane tyre. The JBG jacking unit is offered generally, but not exclusively, with the swivel castor option. Other wheel and castor types can be fitted to all models of the Brauer jacking units, should this be a consideration please contact Brauer sales.

600KG JACKING UNIT

JGG Series

Load rating 1000kg

Brauer have developed a range of jacking units expanding further our comprehensive range of heavy duty castors and wheels. The jacking units are highly adaptable across a broad range of environments and applications. Many options are available giving this new product unsurpassed flexibility for the worldwide market place. Availability and delivery is enhanced due to products being totally manufactured within the wheels and castors division based in the UK. Robust design. Load rating up to 1000kg per unit. Integral swivel mechanism incorporated into jacking castor. Designed to suit our GG fixed castor. Wheel options from 100mm to 250mm diameter. Wheel options include steel, polyurethane and nylon. Jacking units now form part of Brauer comprehensive range of wheels and castors.

Approximate weight: 25Kg

JWG Series

Load rating 2500kg

BRAUER®

Brauer have developed a Jacking Unit, which is now available for general purchase. The Jacking unit is adaptable to many environments and applications due to our in house design team and manufacturing capability. Many options are available due to the integration of our WG Series Castor into the design, giving unsurpassed flexibility to the market place. Availability and delivery are enhanced because we are a leading UK manufacturer and control all aspects of the Jacking Unit.

Load rating up to 2500kg per unit.

Bespoke design which is now incorporated into our full range of wheels and castors. Robust design. Designed to suit our WG castor range. Wheel options from 150mm to 300mm diameter. Swivel and fixed castor options. Flat foot option for non castor applications. Approximate weight 35Kg.

(E) Swivel top plate thickness 26mm

(H) Fixed top plate thickness 12mm

NOTE: Also available with other wheel types.

2500KG JACKING UNIT

A positive means of stabilising trolley and mobile equipment

Floor lock top plates have fixing holes to suit 10mm diameter bolts

Designed to steady the equipment to which they are fitted and stop horizontal movement, floor locks are never intended to act as a jack. Any attempt to vary the fitting height from the catalogue specification will give failure and/or damage. There is some built-in resilience in the foot pad, which will allow some variations in floor level. Nonetheless it is essential that the floor lock is fitted as closely as possible to one of the swivel castors. Please note that the floor lock can be severely damaged if the linkage is operated whilst the truck is moving.
